

Hydrochemical Routes to Recycle NiMH Batteries and Fluorescent Lamps

Christian Ekberg, Martina Petranikova, Kristian Larsson, Irena Herdzik Koniecko, Teodora Retegan, Cristian Tunsu

*Chalmers University of Technology, Gothenburg, Sweden
Nuclear Chemistry and Industrial Materials Recycling*

Conclusions

- A centre for multidisciplinary research and development have been established in Sweden. The competence Centre Recycling, CCR.
- New members are welcome from both academia, research organisations and industry. Please contact: che@chalmers.se or bms@chalmers.se
- A recycling route for Toyota Prius NiMH batteries has been developed and tested on semi pilot scale
- A recycling route for Hg contaminated fluorescent lamp waste has been developed and testing in pilot scale has begun

Since 2007

Vision – CCR

To be the leading Research and Technology Development (RTD) constellation for initiating, coordinating and performing R&TD in the field of circular use of materials in Sweden

To meet this vision we will build and develop a creative, **extremely multi disciplinary** research and innovation environment attractive to academy and industry in Sweden and also internationally.

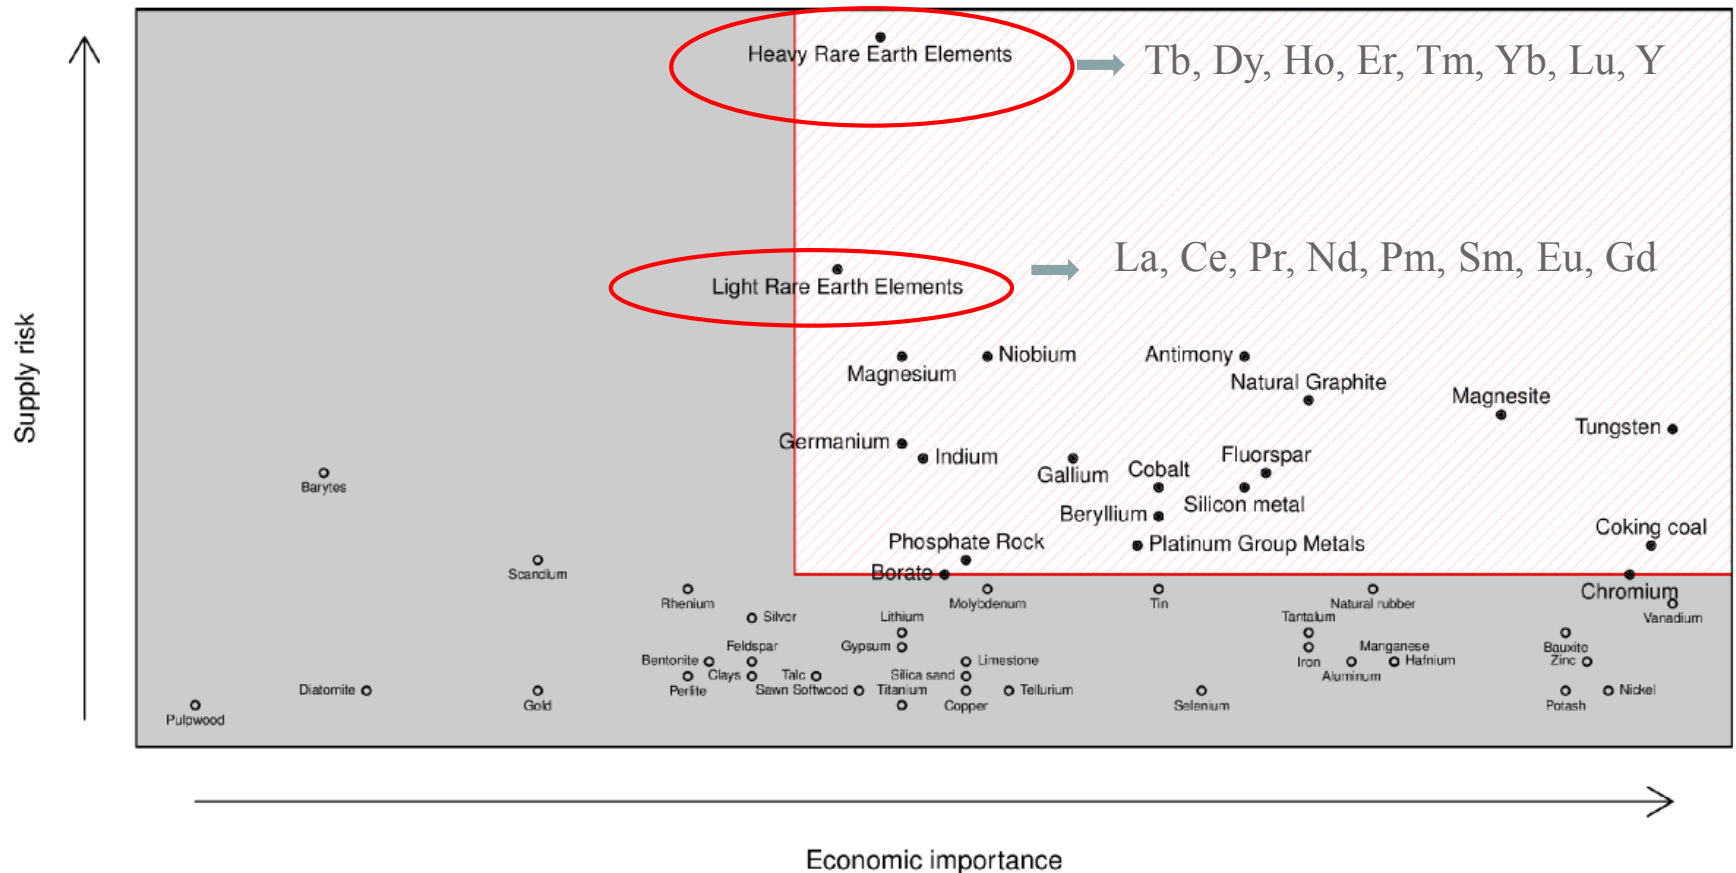

Mission

- To act as a creative R&I arena (meeting place) for the stakeholders and the value circles
- To initiate, coordinate and execute world-class research and innovation projects
- To bring research results to industrial exploitation and use in the society by creating an interdisciplinary research and innovation environment where industrial need and research excellence are combined
- To promote innovations and scientific advances that lead to a more sustainable material use in industry/society

All missions should contribute to the development of a competitive industry in Sweden and to the implementation of a sustainable, circular material use in industry/society.

Obtaining access to non-energy raw materials is becoming a challenge to many resource-dependent countries all over the world.

REEs presently have the highest supply risk for the EU.

This has focused attention towards the possibility of recovering REEs from various end-of-life products.

But how much of the REEs are recovered from end-of-life products?

Developing an industrial process for the recovery of REEs is of great importance!

The focus of today's presentation: HEV NiMH batteries and fluorescent lamps.

Recovery of metals from NiMH batteries

NiMH as a secondary raw material

Metal content:

3kg of REEs/ battery

REEs consumption for HEV battery production

Battery construction

Battery

Modul

Cathode:

nickel grid
+
 Ni(OH)_2

Anode:

steel grid
+
 $\text{MmNi}_{5-x-y-z}\text{Co}_x\text{Mn}_y\text{Al}_z$

(Mm: mixture of La,
Ce, Pr, Nd) LaNi_5

REEs are present
mostly in anode
material

Hydrometallurgical process developed at Chalmers

**1. Dismantling of
batteries**

**2. Leaching of electrode
material with HCl**

**3. Solvent extraction
using Cyanex 923**

NiMH battery dismantling

Toyota Prius Battery – before dismantling

Battery modules —38

Other parts

- cables and copper
- modules
- steel
- aluminium
- plastic
- printed circuit boards
- other

NiMH module dismantling

Module before dismantling

Module casing — 6 units

Cathodes and anodes

Material balance of modules

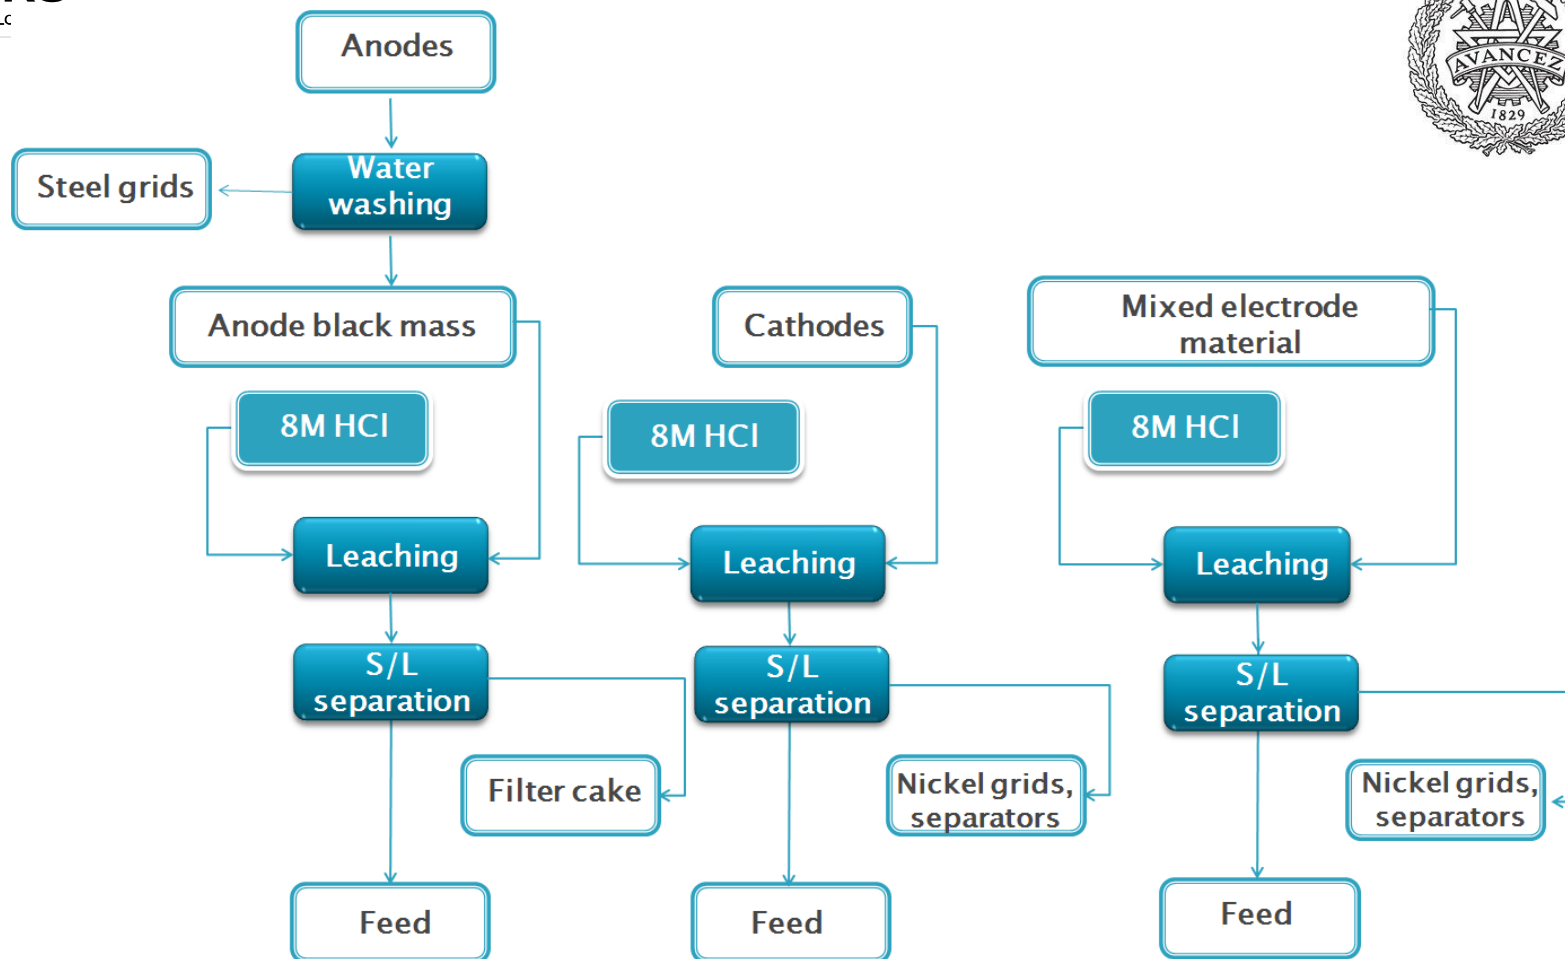

Element	Cathode material [wt.%]	Anode material [wt.%]
Al	0.5	2.7
Ce	nd	4.8
Co	8.4	4.1
Fe	2.6	0.4
K	16.7	0.4
La	nd	23.8
Mg	0.7	0.1
Mn	4.4	10.1
Nd	nd	3.9
Ni	63.4	47.4
Pr	nd	1.7
Y	1.2	1.4
Zn	0.8	0.1

Leaching

- glass reactor with double wall (with heating/cooling system)
- volume: 2 or 5L
- titration devices

material	s/l ratio	Leaching temperature	pH
anodic	1/ 3.75	50-70°C	1
cathodic	1/ 1.96	30°C	1
mixed	1/ 2.7	30°C	1

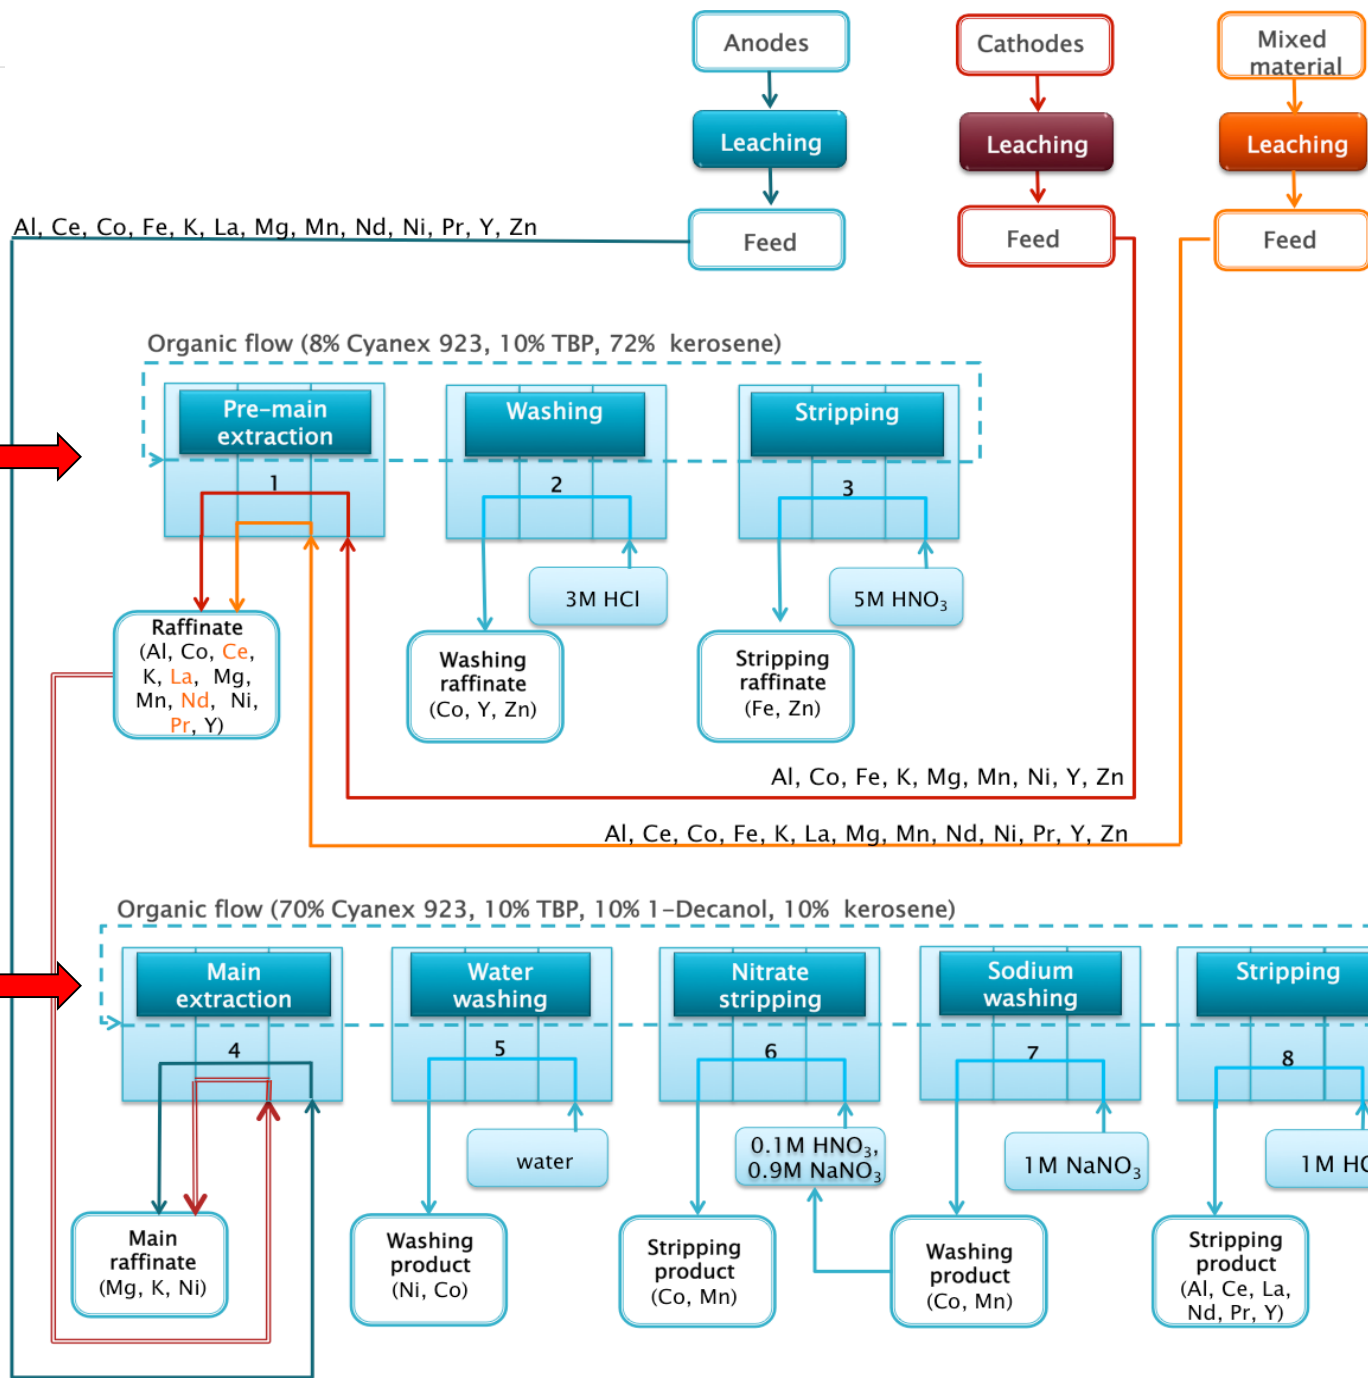

Molar concentration of metals in the solutions after leaching:

Element	Anodic material (+50% reflux of raffinate)	Cathodic material	Mixed material (+30% reflux of raffinate)
Al	0.07	0.01	0.05
Ce	0.08	nd	0.04
Co	0.09	0.54	0.19
Fe	0.003	0.01	0.007
K	0.001	0.04	0.009
La	0.23	nd	0.14
Mg	nd	0.09	0.03
Mn	0.13	0.01	0.1
Nd	0.023	nd	0.02
Ni	3.3	3.3	3.1
Pr	0.01	nd	0.01
Y	0.01	0.05	0.02
Zn	nd	0.03	0.01

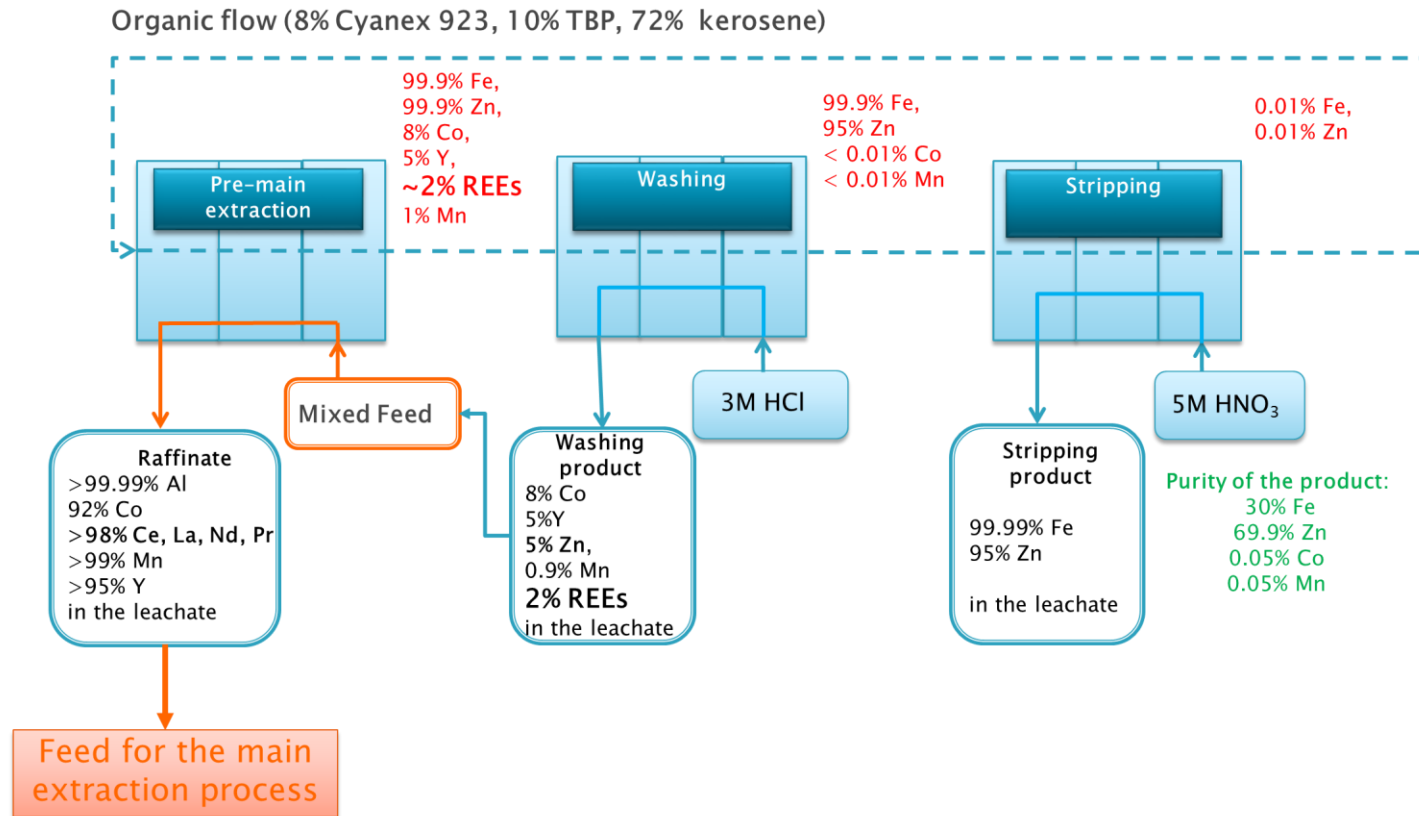

Solvent extraction

- **Extractant:** *Cyanex 923*:
mixture of trialkyl-phosphine oxides: $R_3P(O)$,
 $R_2R'P(O)$, $RR'_2P(O)$, $R'_3P(O)$
 $R = [CH_3(CH_2)_7]$ - normal octyl,
 $R' = [CH_3(CH_2)_7]$ - normal hexyl
- **Solvent:** kerosene
- **Equipment:**
 - PVDF mixer-settlers (volume: 120, 500 ml)
 - electromagnetic pumps

“Pre-main extraction” for recovery of Zn and Fe from “mixed” leachate

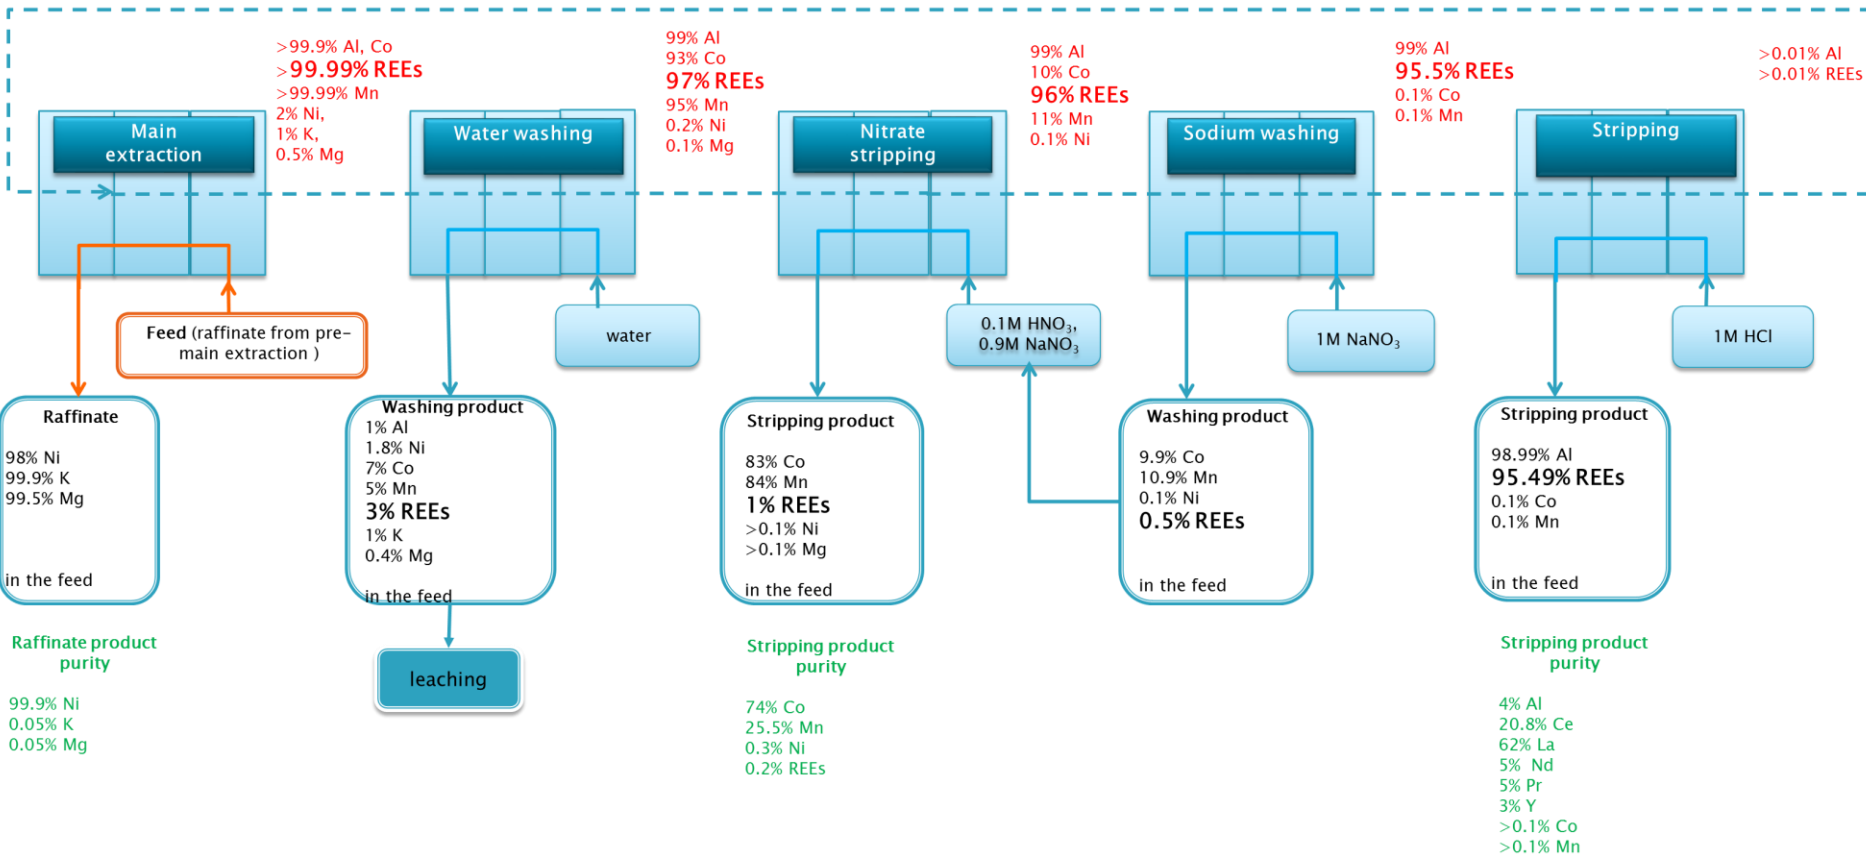

Values in red relate to metal in the organic feed.

Values in black relate to metal in the aqueous feed.

All the values are reported in regard to the metal concentration in the mixed leachate.

“Main extraction” for metal recovery from “mixed” leachate

Organic flow (70% Cyanex 923, 10% TBP, 10% 1-Decanol, 10% kerosene)

Values in red relate to metal in the organic feed.

Values in black relate to metal in the aqueous feed.

All the values are reported in regard to the metal concentration in the initial aqueous feed.

- ☐ Hydrometallurgical method for recovery and separation metals from car NiMH batteries have been developed and tested in a pilot plant scale.
- ☐ Three different starting materials can be obtained for processing - depending on the way of dismantling – cathodic, anodic and mixed material.
- ☐ Metals ions present in the leaching liquors can be separated using solvating extractant trialkylphosphine oxide mixture Cyanex 923.
- ☐ Zn and iron can be removed from solution after leaching cathodic and mixed material using pre-main extraction process.
- ☐ Ni, Mg and K can be separated from feed after main extraction process, because they are not extracted at given conditions.
- ☐ Co, Mn is recovered by stripping using nitrate and sodium strip.
- ☐ Al, Ce, La, Nd, Pr and Y are stripped from organic phase using 1MHCl.

Recovery of REEs from fluorescent lamp waste

Fluorescent lamps

Phosphor type	Possible compounds
Red phosphor	$\text{Y}_2\text{O}_3:\text{Eu}^{3+}$
Blue phosphor	$\text{BaMgAl}_{10}\text{O}_{17}:\text{Eu}^{2+}$ $(\text{Sr},\text{Ca},\text{Ba})_5(\text{PO}_4)_3\text{Cl}:\text{Eu}^{2+}$
Green phosphor	$\text{CeMgAl}_{10}\text{O}_{17}:\text{Tb}^{3+}$ $\text{LaPO}_4:\text{Ce}^{3+}, \text{Tb}^{3+}$ $(\text{Ce},\text{Tb})\text{MgAl}_{11}\text{O}_{19}$ $(\text{Ce},\text{Gd},\text{Tb})\text{MgB}_5\text{O}_{10}$

Phosphors-containing fraction obtained after crushing of end of life fluorescent lamps:

Large amounts of impurities: glass (mainly), small plastic and metallic parts, packaging remains.

REEs content in a waste phosphors fraction after some removal of glass impurities

Metal	g metal/kg waste	Metal	g metal/kg waste	Metal	g metal/kg waste
Al	13.12 ± 0.19	K	0.43 ± 0.02	W	0.21 ± 0.01
B	2.91 ± 0.04	Mg	2.55 ± 0.04	Zn	0.42 ± 0.0004
Ba	15.67 ± 0.36	Mn	2.57 ± 0.03	Y	187.15 ± 4.42
Ca	97.00 ± 2.49	Na	2.58 ± 0.09	Eu	11.39 ± 0.24
Cd	0.26 ± 0.004	Ni	0.10 ± 0.002	Gd	5.51 ± 0.08
Cr	0.03 ± 0.0003	Pb	0.21 ± 0.004	Ce	3.06 ± 0.098
Cu	0.13 ± 0.002	Sb	1.25 ± 0.02	La	2.14 ± 0.13
Fe	1.74 ± 0.02	Si	0.26 ± 0.002	Tb	1.76 ± 0.04
Hg	0.30 ± 0.002	Sn	0.07 ± 0.001	<i>Total REEs</i>	<i>211 ± 5.01</i>

Bastnäsite ore mined at Mountain Pass for the production of REEs contains approx. 90 g/kg RE oxides (*Molycorp Inc.*)

Selective leaching of metals (4 stages)

- 1.** Leaching of Hg with I₂/KI solution in 2 h. at ambient temperature (>90% efficiency);
- 2.** Leaching of other impurity metals (notably Ca) with nitric acid. Short contact time (15 min.) leaches >90% of the Ca, with minor REEs losses (2-3%);
- 3.** Leaching of Eu and Y left in the residue (>95% efficiency) with nitric acid, at ambient temperature (<24 h.);
- 4.** The other four REEs (Ce, La, Tb and Gd) are harder to leach and require concentrated acids/temperature/ultrasound. Selective leaching (sort-of) possible. Alternate method: alkali fusion.

***Metal concentration in the REEs-rich leachate
of a fluorescent lamp waste fraction (3rd
leaching stage)***

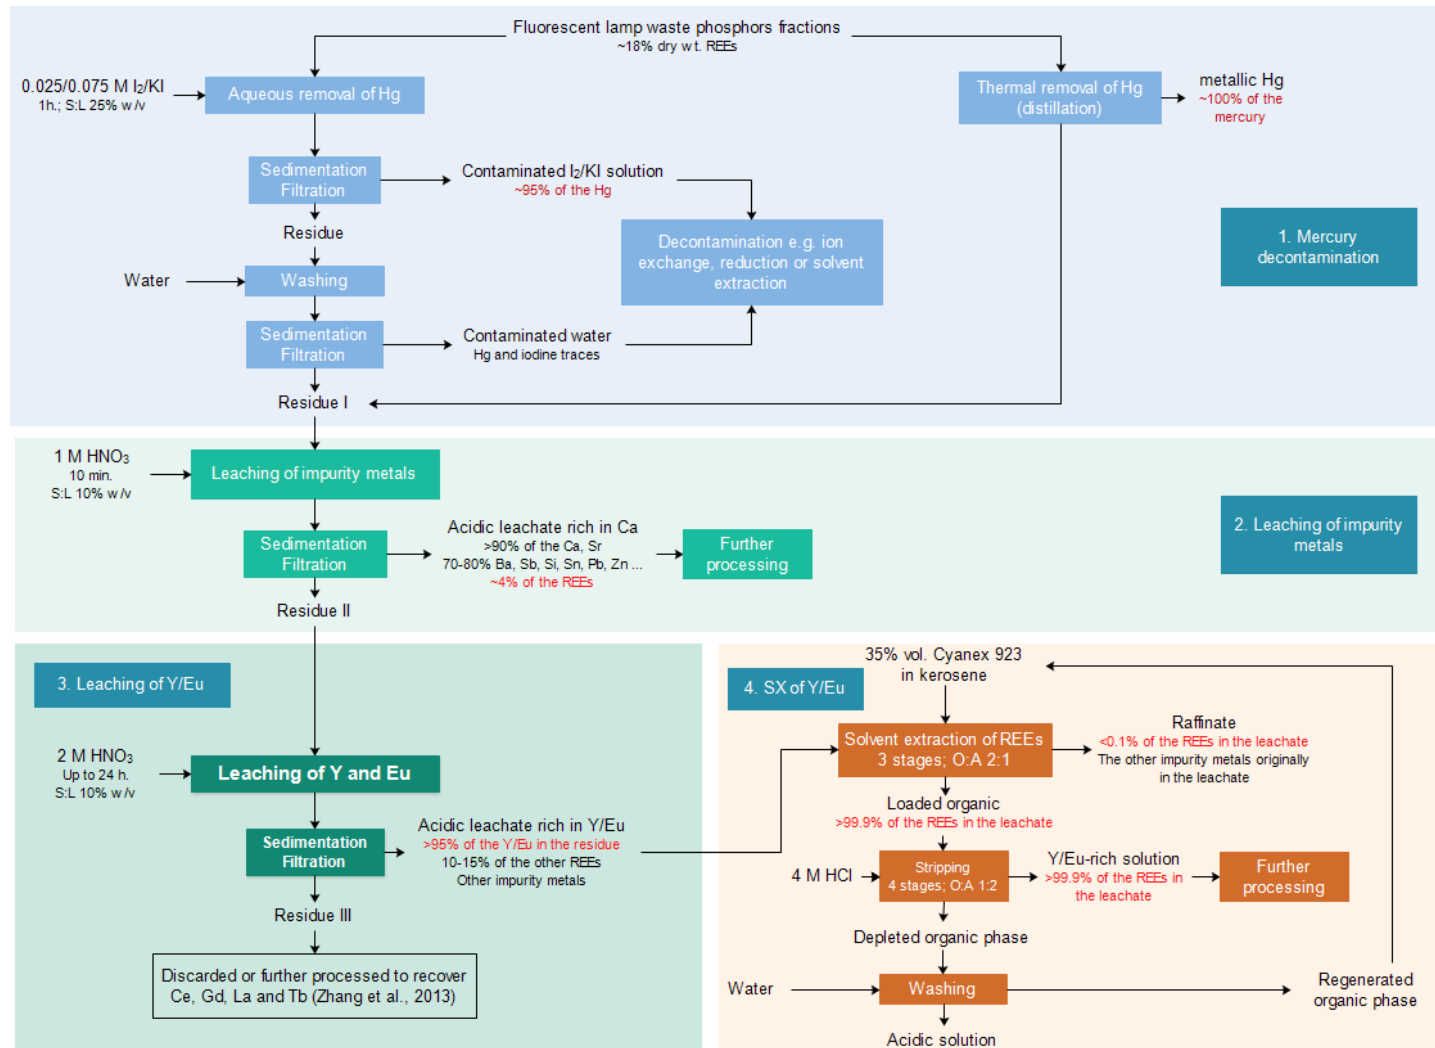

Metal	Concentration (g/L)	Metal	Concentration (g/L)
Al	0.12	La	0.003
B	0.11	Mg	0.058
Ba	0.11	Mn	0.042
Ca	1.18	Ni	0.002
Cd	0.005	Pb	0.004
Ce	0.055	Sb	0.050
Cr	0.0003	Si	0.044
Eu	1.51	Tb	0.038
Fe	0.03	Y	25.45
Gd	0.14	Zn	0.004

Solvent extraction in mixer-settlers

- 3 extraction stages; 50% v/v Cyanex 923 in kerosene; O:A = 2:1;
- Stripping with HCl.

Current flowsheet

Conclusions

- A centre for multidisciplinary research and development have been established in Sweden. The competence Centre Recycling, CCR.
- New members are welcome from both academia, research organisations and industry. Please contact: che@chalmers.se or bms@chalmers.se
- A recycling route for Toyota Prius NiMH batteries has been developed and tested on semi pilot scale
- A recycling route for Hg contaminated fluorescent lamp waste has been developed and testing in pilot scale has begun
